

# Quality-assured IT software packaging for automotive group

## HOW ICARUS OPTIMIZED THE AUTOMATION PROCESS THROUGH HIGH-QUALITY SOFTWARE PACKAGING

A leading automotive manufacturer wanted to streamline its automation processes at various locations using the Tecnomatix suite. It lacked the custom configuration and software components needed to optimize its planning processes with essential tools. The existing standard installation did not meet the OEM's specific requirements and required modification.

### Objective

- Development of a quality-assured IT software package
- Ensuring installability and uninstallability
- Group-wide availability
- Support through uniform software configuration

### Proceed

- Review and implementation of installation requirements
- Software package development using Microsoft Visual Studio Script
- IT security and open source testing
- Test cycles in a near-production environment for optimization

### Result

- Setting up a functional installation package
- Group-wide distribution also possible with suppliers
- Consistent support based on the software package
- Full control over software versions and components

**"Icarus' automation gives us full control over all versions and components. This ensures optimal use of the Tecnomatix Suite."**
